

GBP Menace

Poll-based VGBP arbitrage across Celo, Solana & VNX Platform

4 active routes · USDT-normalized PnL · celo↔vnx USDC **disabled**

DRY RUN SANITY 30/30 PASS

2026-06-16 · github.com/Giansensey007/gbp_menace_

TRADE SIZE
200–2,000
VGBP per route

MIN PROFIT
≥\$5.00
net after fees

POLL CYCLE
60 s
between poll cycles

INDIRECT PREMIUM
≥\$5.00
B beats A by this

Route A — direct celo↔sol

Route B — indirect SOL↔platform / CCTP

Each row = one scanned direction. Dashed box = post-trade stable rebalance (direction matches start chain).

Direct vs indirect

A (direct): VGBP gap Celo↔Sol only.
B (indirect): exit via VNX platform + ETH/CCTP. Extra fees.
When both win: pick B only if B net – A net ≥ \$5; else keep A.

A?	B?	Pick
No	No	Skip
Yes	No	Direct
No	Yes	Indirect
Yes	Yes	B if Δ ≥ \$5

Δ = best B – best A

Before every poll

Scan A1+A2, then B1+B2 · size 200–2k

Bridges

VNX VGBP + platform
Wormhole USDT (Route A)
CCTP USDC Sol↔ETH (Route B)

Deploy: `python -m src.main (200–2k VGBP)`
Token: VGBP | Hub: USDT-normalized PnL

Probe: `scripts/test_probe_trades.py (5 VGBP)`
Risk: API pacing · bridge timeout · peg 0.98–1.02
